

PMU Students in the “Power Generation” class spent a day visiting the power plant where they were given opportunity to tour various components of the plant. While there, PMU students gathered technical and operational data that helped in conducting thermal and performance analysis of key components of the plant as part of the course requirements. Outcomes of the students’ works were presented as one of the course final project requirements. PMU will continue to pursue building strong partnerships with area employers and constituents to fulfill university commitment to the community and to enrich students’ experiences. The trip was facilitated by one of the students in the evening program who is the deputy operation manager of the plant.
